ABSTRACT

Effective planning of vocational education programs requires information about both the educational demand of individuals and the manpower demands of business and industry. Two characteristics of the manpower demand in Minnesota which are defined and estimated in this report are occupational demand, the total number of employment positions in a given geographic area, and unfilled positions, the number of positions to be newly filled in a given time period. Occupational demand for a specific occupation may be defined as the number of positions in the occupation last year plus the average annual growth or decline in positions. Thus, unfilled positions in the occupation may be defined as the average annual growth or decline in positions plus the annual number of positions vacated by worker withdrawal. The methods used to estimate occupational demand and unfilled positions are detailed in the report, along with tabular data for the State, for the Minneapolis-St. Paul metropolitan area, and for the 11 economic regions of the State. Limitations of the estimates and assumptions made are pointed out. No implications are drawn as to how demand will be filled by supply; only the total number of positions (occupational demand) and the number of unfilled positions have been estimated. The purpose of this report is to supplement existing information provided by the Minnesota Department of Manpower Services. (MF)

OCCUPATIONAL DEMAND IN MINNESOTA FOR 1973

Effective planning of vocational education programs requires information about both the educational demand of individuals and the manpower demands of business and industry. Educational demands of individuals refer to the scope and kind of training that is consistent with individual needs and abilities to benefit from vocational education. Manpower demands of business and industry refer to the number and kind of occupational positions needed to be filled in terms of training requirements, and where and when the positions are available.

The purpose of this report is to supplement existing information on the manpower demands of business and industry in Minnesota. As a supplement, the information should be used and interpreted with other pertinent information, which may be more specific to a particular problem, situation, or location.

Two characteristics of the manpower demand in Minnesota are defined and estimated in this report. These characteristics are occupational demand and unfilled positions.

Occupational demand is defined as the total number of employment positions in a given geographic area, such as a state or an economic region. This characteristic describes the scope or size of an occupation in terms of total number of positions. The second characteristic, unfilled positions, is defined as the number of positions which are to be newly filled in a given time period; it is part of occupational demand. Unfilled positions more specifically define the number of new employees needed during a time period.

The Minnesota Department of Manpower Services provides Minnesota with an estimate of occupational demand for 1968 and 1975.¹ These estimates are based on projected industry growth in Minnesota, projected occupational staffing of industries for the Nation, and Census reports on occupational and industrial categorization of the jobs held by the population in Minnesota. Periodically, as new information becomes available (such as the 1970 Census) these estimates of occupational demand will be updated.

A gross estimate of unfilled positions in each of several occupations can be derived by considering two major factors. The first is average growth or decline in occupational demand for a given occupation. Growth is addition of new positions over time, while decline is the elimination of existing positions over time. The second factor is the annual replacement of workers who die, retire, or withdraw from the labor force for other reasons.

Using these factors and a year as the appropriate time period, occupational demand for a specific occupation can be defined as the number of positions in the occupation last year plus the average annual growth or decline in positions. Similarly, unfilled positions in the occupation can be defined as the average annual growth or decline in positions plus the annual number of positions which were vacated because of death, retirement, or worker withdrawal for other reasons.

¹"1975 Employment, Minnesota and Minneapolis-St. Paul Metropolitan Area and 11 Economic Regions", Minnesota Department of Manpower Services, St. Paul, Minnesota, January, 1970.

The next section of this report describes how these factors were specifically calculated and combined in the estimation of occupational demand and unfilled positions for 1973. The same methods can be used to generate estimates for other future periods.

METHOD OF ESTIMATION

In this section of the report, the estimates of occupational demand and unfilled positions for 1973 for the nine broadest occupational categories in the state of Minnesota will be used to illustrate how specific calculations were made. Occupational demand for 1973 is the first estimate which will be described. It is derived by using data supplied by the Minnesota Department of Manpower Services.² They provide occupational demand estimates for 1968 and 1975 using a linear projection.³ Average annual growth or decline can be estimated by subtracting the number of positions estimated for 1968 from the number of positions in 1975 and dividing by seven (the number of years between 1968 and 1975). As an example from Table 1, there were 256,469 professional positions projected for 1975 and 213,304 professional positions estimated in 1968. Subtracting 213,304 from 256,469 and dividing by seven gives the estimated average growth of 6,166 positions. The annual growth or decline for professionals shown in Table 1 is 6,148; the discrepancy between 6,166 and 6,148 was caused by rounding errors when annual growth or decline was calculated for each of the professionals. In making this calculation, it is assumed that occupational demand grows or declines by a constant annual rate between 1968 and 1975. This means that only general trends in occupational demand are considered; no attempt has been made to take into account year to year changes in the national, state, or local economy which may have a very specific and significant impact on yearly occupational demand.

Estimated occupational demand for 1972 is calculated by multiplying average annual growth or decline by four and adding this product to estimated 1968 occupational demand. Adding one more year of annual growth or decline to the 1972 estimated occupational demand gives 1973 occupational demand. The results of these calculations are shown in Table 2.

The second characteristic to be calculated is unfilled positions. Unfilled positions is the sum of annual growth or decline in demand plus annual number of positions which must be replaced because they were vacated by workers who died, retired, or left the position for some other reason. Annual growth or decline in demand has already been calculated. Annual replacement positions is

² Ibid.

³ The occupation of farmer and farm worker as reported by the Minnesota Department of Manpower services was further sub-divided into three occupations: (a) farmers on farms in economic classification I-IV (defined by the Census of Agriculture, 1969, as those having sales of farm products of \$5000 or more), (b) other farmers (includes those with farm sales of \$4999 or less, part-time and part-retired farm operators, and abnormal farms), and (c) farm workers, using information from the 1959, 1964, and 1969 Census of Agriculture: Minnesota, U.S. Department of Commerce, Bureau of the Census.

Table 1

MINNESOTA ANNUAL GROWTH OR
DECLINE IN OCCUPATIONAL DEMAND

Occupation	1968 Demand	1975 Demand	Annual Growth or Decline
Professional	213,304	256,469	6,148

Laborers (exc. Farm & Mine)	49,864	-211	49,653

derived by multiplying a replacement percentage times the occupational demand in the last time period (1972 for this report). Replacement percentages vary between occupations and by sex of employees. To calculate replacement rates for specific occupations, the number of males and females in the occupation must first be estimated. In this report the percent male and female for occupational categories was derived from the 1960 Census of Population.⁴ The rate for the next broadest occupational category was used for occupations which did not have a male-female percentage reported. The number and percent of males and females in each of the broad occupational categories for 1972 is shown in Table 3. It was assumed that the male-female percentages by occupation remained constant between 1960 and 1972. The validity of this assumption was checked by comparing the male-female percentages for the nine broadest occupational categories for 1960 and 1970⁵ (this was the finest occupational grouping with a sex distribution available from the 1970 Census of Population for Minnesota at this time). The largest deviation for one of the nine occupational categories between 1960 and 1970 was 11 percentage points for clerical and craftsmen. The average deviation in male-female percentages between 1960 and 1970 for the nine broad occupational groups was 4.1 percentage points.

Table 3
PERCENT AND NUMBER OF MALES AND FEMALES
IN 1972 OCCUPATIONAL DEMAND FOR MINNESOTA

Occupation	1972 Demand	% Male	No. Male	% Female	No. Female
Professional	238,889	59	140,945	41	97,944

⁴1960 Census of the Population: General Population Characteristics: Minnesota, U.S. Department of Commerce, Bureau of the Census.

⁵"1970 Census of Population - Fourth Count - Minnesota", Minnesota Analysis and Planning Systems, St. Paul, Minnesota, March, 1972.

After the number of males and females in each occupation is calculated, the number of replacements for each sex can be calculated by multiplying the number of persons of a given sex in an occupation by the replacement rate for that sex and occupation. For example, from Table 4, there are 140,945 male professionals and the replacement rate for male professionals is 1.6 percent. Multiplying 140,945 by .016 results in an estimated annual number of replacements of 2,255. The results for female professionals and the other broad occupational categories is also shown in Table 4. Total number of replacements for a given occupation is the sum of male and female replacements for that occupation. For professionals, the total estimated replacements needed is 2,255 plus 4,799 or 7,054; the discrepancy between 7,054 and 6,495, the number of professional replacements needed as shown in Table 4, is caused by the use of specific male-female percentages and replacement rates for each individual professional occupation and summing over occupations to get total replacements for professionals.

Table 4

MINNESOTA REPLACEMENT RATES AND NUMBERS
BY SEX AND OCCUPATION, 1973

Occupation	Total Male	Male Replacement Rate	Number of Male Replacements	Total Female	Female Replacement Rate	Number of Female Replacements	Total Number of Replacements
Professional	140,945	1.6	2,255	97,944	4.9	4,799	6,495
Manager	114,041	2.5	2,851	17,041	4.7	801	3,136
Clerical	81,329	1.8	1,464	172,823	4.9	8,468	10,140
Sales	74,060	2.0	1,481	43,495	4.7	2,044	3,525
Craftsmen	201,077	1.9	3,820	6,219	4.3	267	3,836
Operatives	189,370	1.5	2,841	56,565	4.1	2,319	4,857
Service	62,849	2.7	1,697	133,555	4.7	6,277	7,885
Farmers and Farm Workers	106,065	2.6	2,758	9,223	2.6	240	3,045
Laborers (exc. Farm & Mine)	48,368	1.7	822	1,496	4.7	70	892

The replacement rates, except for farmers, used in this report were derived by the U.S. Department of Labor.⁶ The rates are based on labor force participation

⁶"Tomorrow's Manpower Needs", U.S. Department of Labor, Bureau of Labor Statistics, Volume 1, Bulletin No. 1606, February, 1969. The replacement rates for farmers was derived from information presented in the 1969 Census of Agriculture: Minnesota, U.S. Department of Commerce, Bureau of the Census, 1971.

rate and age distribution of employees in each of several occupations. Replacements include employment positions vacated for reasons of death, retirement or some other reason.

Unfilled positions is calculated by adding annual growth and decline (Table 1) and annual replacements (Table 4). In making this calculation, two assumptions are made. First, it is assumed that all persons who die, retire, or leave the labor force for other reasons leave a position which will again be filled. Second, it is assumed that when annual growth or decline is negative (the number in the occupation is decreasing), the employees losing their jobs will have first priority on unfilled, replacement positions. This latter assumption may not be realistic for some occupations. For example, persons in the occupation of farmer are self employed and when they go out of business, for reasons other than specified under annual replacement, they do not usually buy another farm. With these assumptions enforced, unfilled positions for each of the nine broadest occupational categories are shown in Table 5.

Table 5

MINNESOTA UNFILLED POSITIONS IN 1973

Occupation	Annual Growth or Decline	Annual Replacements	Unfilled Positions
Professional	6,148	6,495	12,643
Manager	1,504	3,136	4,640
Clerical	5,758	10,140	15,898
Sales	4,549	3,525	5,074
Craftsmen	3,561	3,836	7,397

Service	3,909	7,885	11,794
Farmers and Farm Workers	-4,352	3,045	-1,307
Laborers (exc. Farm & Mine)	-211	892	681

INTERPRETATION OF ESTIMATES

The format for the tables which are shown in the next section of this report are the same as in Table 6. Occupational demand represents an estimate of the total number of employment positions in a given geographic area (stated in the table heading) for the specified occupation in 1973. The second and third columns, respectively, contain estimates of annual growth or decline in positions and annual number of positions to be replaced because employees vacated the positions by death, retirement or other reasons. The fourth column contains an estimate of unfilled positions in 1973 for the given geographic area and specified occupation. It is a sum of annual growth or decline and annual replacements (columns 2 and 3). The last column contains the percent of total unfilled positions represented by the unfilled positions in the specified occupation. For example, in Minnesota for 1973 there is a total estimated unfilled positions of 66,025 which is calculated by summing across all the occupational groups in Table 6. Of this total, 12,643 are unfilled professional positions; therefore, professional unfilled positions represent 12,643 divided by 66,025 multiplied by 100 or 19.4 percent of the State's total unfilled positions. This percentage indicates the relative number of unfilled positions in a particular occupation compared to total unfilled positions.

Table 6

MINNESOTA OCCUPATIONAL DEMAND AND UNFILLED POSITIONS FOR 1973

Occupation	1973 Demand	Estimated Annual Growth or Decline	Estimated Annual Replacement	1973 Estimated Unfilled Positions	% of Total Unfilled Positions
Professional	245,047	6,148	6,495	12,643	19.2
Managers	132,586	1,504	3,136	4,640	7.0
Clerical	259,910	5,758	10,140	15,898	24.1
Sales	119,104	1,549	3,525	5,074	7.7
Craftsmen	210,857	3,561	3,836	7,397	11.2
Operatives	250,283	4,348	4,857	9,205	13.9
Service	200,313	3,909	7,885	11,794	17.9
Farmers and Farm Workers	110,936	-4,352	3,045	-1,307	-2.0
Laborers (exc. Farm & Mine)	49,653	-211	892	681	1.0
TOTAL				66,025	100.0

The next section of this report presents occupational demand and unfilled positions for 1973 in (a) Minnesota, (b) Minneapolis-St. Paul metropolitan area, (c) outstate Minnesota, excluding the Minneapolis-St. Paul metropolitan area, and (d) the 11 economic regions. For the first three geographic areas, the information is presented for 151 unique occupations. For the 11 economic regions, only 44 occupations are used because of the reduction in total number of employees for regions as compared to the State. A map showing the 11 economic regions is provided in the Appendix.

The reader is cautioned in interpreting the information reported on occupational demand and unfilled positions. Interpretation should be tempered by noting that the numbers are estimates based on several assumptions and limitations. Assumptions have already been pointed out where they were appropriate. An additional assumption is that in calculating number of replacements for a given occupation in an economic region, the percent males and females in the occupation and the replacement rate for males and females are assumed to be the same as for the total state for that occupation. The limitations of the estimates are that only the major factors affecting occupational demand and unfilled positions, namely growth and decline and replacements, are considered. The impact of factors such as yearly changes in economic conditions and geographic mobility of employers have not been used in making the estimates. The validity of the assumptions and the impact of the limitations become more critical as the geographic region and the number of persons in a given occupation become smaller.

No attempt has been made to estimate the amount of error in the estimates. It is reasonable to conclude that the percent error is smaller for the larger numeric estimate than for the very small estimate. The relative size of estimates between occupations may be more accurate than the absolute estimate for a given occupation. As stated in the introduction to this report, information presented in the following tables should be used to supplement existing information.

Lastly, the information is an estimate of demand. It makes no implications of how demand will be filled by supply. Only the number total of positions (occupational demand) and the number of unfilled positions has been estimated. These latter positions could be filled by persons currently available for employment or employed as well as persons who in the past have been unavailable for employment (students, homemakers, ex-military service persons, etc.)
